Risk Management

Preventing Overexertion Injuries - Strains
Risk Management

- Strains & Sprains are Georgia’s #2 injury cause.
- In FY2019 901 Strain injuries, 17% of our total injuries
- These injuries will probably end up costing around $8,000,000
Risk Management

What is an Overexertion Injury?

1. Sprains – stretching or tearing ligament
2. Strains – stretching or tearing tendons or muscles

**Muscles** – the tissue responsible for movement of joints. They are attached to bone by tendons, and shorten to create movement of a joint.

**Tendons** – the tough connective tissue which connects muscle to bone

**Ligaments** – very tough connective tissue which connect bone to bone, and hold the tendons in place and stabilize the joints.
How do Overexertion Injuries Occur?

Overexertion occurs when the load, whether lifted, carried, pushed, pulled or otherwise handled, exceeds the limits of the human joint system doing the work.

In this case the “lower back”
Overexertion injuries have been associated with these activities:

- lifting
- repeated bending at the waist
- bending at the waist with twisting
- long term bending at the waist
- pushing/pulling
- carrying
- reaching
- long term poor posture - sitting or standing
- sitting while absorbing vibration through the body (as in truck driving)
Personal Factors

Some personal factors have been associated with overexertion injuries:

- aging and its loss of body flexibility (becoming stiff)
- poor physical condition
- overweight
Risk Management

What do people say who have had overexertion injuries?

- I was moving too quickly to perform the task
- I was positioned in an awkward posture

So...
Perform the task twice:

Once With Your

and

Once With Your

As you think about the task, determine what has to be done to perform it safely and then follow through.
Risk Management
Good Techniques For Lifting:

• Assess the weight of the load (by observing or pushing).
• Make sure your footing is stable and the path is clear.
• Bend at the knees.
• Hug the load (keep the load as close to the body as possible).
• Keep the back straight.
• Avoid twisting.
• Avoid heavy loads (lighten if possible).
• Get help with heavy loads.
The process of moving materials

- **Reaching** for the load by bending, reaching, or squatting
- **Lifting** the load
- **Transferring** the weight of the load to a carrying position
- **Carrying** the load to the needed location
- **Depositing** the load by
  - lowering it to the ground,
  - throwing it, or
  - handing it to another person
Risk Management

Plan the lift

• How much am I lifting?
• Where is it going?
• What is in the way?
• What is the surface like between me and my destination

“If you fail to plan, you are planning to fail.”

- Benjamin Franklin
Risk Management

Ideas for proper carrying:

If there is a mechanical device like a hand truck, cart or pallet jack... use it! (the more you carry something, the greater the chance that you can be injured)

If there are no mechanical devices...

Keep the load as close to the body as possible.

Better to take more loads of less weight than try to take it all at once.
Risk Management
Ideas for reducing reaching

Remove obstacles

This bin has fold down door so the worker can get the product with less bending

Slide closer

An adjustable height pallet jack with a turntable would allow this worker to turn and raise the load to get the product, instead of reaching.

Reduce shelf depth and try to store products between knee and shoulder height

Reduce package size
Risk Management

Reducing reaching

Reduce Shelf Depth

Install Gravity Feed Racks
Risk Management

Ideas for reducing lifting hazards

- Use mechanical assistance
- Team lifting
- Use a mobile ladder
Good Ideas for Pushing/Pulling:

If you have the option, push rather than pull.

The handles on the carts to the right have been modified so persons of different heights can push them with their hands at the appropriate height.
Risk Management

Reducing bending

Add handles

The manufacturer of this product included cutout handles in the box, so the handler could lift it from a higher level. Also, storing them on one or more pallets raises the level of the handles even more.
Reducing lifting

Arrange storage

This person has placed a cart just below the level of the shelf, so she can just slide the box onto the cart deck rather than lift it.
